## Dataset Key Phrases

Companion File Name format And Version	Date This File Generated archive Version Number	Table Explanation Of Zero Or Negative Values
None ; 0	2004/07/20 ; 1	Blank corrections are performed after samples are compared to the DL and flagged accordingly. Only the variables that have a mean blank concentration that is >5% of the mean air concentration (in units of ug/filter) are corrected by subtracting the mean blank concentration (in ug/filter). In some cases this results in final concentrations in ug/m^3 that are negative or less than the stated detection limit (in ug/m^3). Such samples are not flagged as BDL because on a ug/filter basis before blank correction they were above the detection limit. The user may also choose to classify this samples as BDL.

Detection limits (DL) are based upon 3*SD of field blanks in ug/filter. Non blank-corrected laboratory analysis results in ug/filter for each sample are compared to this DL to determine if the sample is BDL and then flagged accordingly (V1 means BDL).	no uncertainty reported	None	None
